

ABSTRACT

An agricultural machine including a body that at least partially rests on the ground.

The body can be hitched to a tractor vehicle by at least one link defining a first pivoting axle directed upwards; a second pivoting axle that is substantially horizontal is directed according to a direction of advancement of the agricultural machine, and a third pivoting axis that is substantially horizontal is directed across the direction of advancement. The agricultural machine also includes an adapter firmly connected to a hitch bar of the tractor vehicle, a support axle, and at least one jaw including an opening that widens according to a substantially vertical direction. During hitching, the support axle is engaged inside the jaw.
